| 16. Abstract <p>A preliminary model of U.S. light-duty vehicle demand is presented which contains an integrated analysis of automobiles and light trucks (under 10,000 lbs. GVW). The model has been estimated using both cross-section and time-series data, and is a development of previous Wharton models. It is a long-run, annual, econometric model providing both forecasts and policy analyses. Light trucks are divided into personal-use and commercial-use categories. The latter are quite distinct in behavior, while personal-use truck demand is combined with automobile demand, and shows many similarities in its determinants. The model includes relationships and estimates for: vehicles in operation, sales, new registrations, scrappage, purchase prices, fuel economy, vehicle miles travelled, gasoline consumption, other operating costs, taxes, and the influence of demographics.</p> | | | | | |

PREFACE

This study is a continuation of a program undertaken by Wharton Econometric Forecasting Associates on behalf of the Transportation Systems Center of the Department of Transportation. This research has provided technical information for rule-making support of the Automobile Fuel Economy Regulation program. The authors would like to acknowledge the help provided by other members of the Wharton staff, and the advice and critical comments of the TSC technical monitors Ron Mauri and Stewart Butler.

1. INTRODUCTION

1.1 BACKGROUND

This study, a continuation of a program undertaken by Wharton Econometric Forecasting Associates (WEFA) on behalf of the Transportation Systems Center (TSC) of the Department of Transportation (DOT), has provided technical information for rule-making support of the Automobile Fuel Economy Regulation (AFER) program.

Wharton's research program began with the development of the Automobile Demand Model^{1/}, extensively used for forecasting and policy analysis during 1977, and for examining a wide range of alternative issues and scenarios. The Wharton Motor Vehicle Demand Model (Mark I)^{2/} was a revised, re-estimated and improved version of the original. This report documents the results, to date, of the development of the Mark II version of the model.

1.2 RESEARCH OBJECTIVES

The objective of this phase of the research was to extend the model to incorporate projections of the demand for light duty trucks (LDTs). The LDT analysis is integrated with the automobile demand analysis in a consistent manner. The model permits the assessment of the joint impacts of changes in

^{1/}George R. Schink and Colin J. Loxley, An Analysis of the Automobile Market: Modeling the Long-Run Determinants of the Demand for Automobiles, DOT-TSC-NHTSA-79-49, final report to the Department of Transportation, Transportation Systems Center, December 1979.

^{2/}Colin Loxley, Tim Osiecki, Kate Rodenrys, and Sheela Thanawala, Revisions to the Wharton EFA Automobile Demand Model: The Wharton EFA Motor Vehicle Demand Model (Mark I), DOT-TSC-NHTSA-80-23, final report to the Department of Transportation, Transportation Systems Center, June 1980.

government policies on both cars and trucks. It also permits an assessment of the economic environment for the purposes of forecasting and scenario analysis with respect to the AFER program.

1.3 REPORT OUTLINE

Section 2, Model Outline, presents the overall structure and philosophy of the model in order to provide a broad, non-technical overview of the research. The detailed discussion of the model equations grouped by type of variable is contained in Section 3. The results of a preliminary forecast with the new model are presented in Section 4. Simulation and multiplier results are discussed in Section 5. Appendix A contains details of LDT classification by type and by nameplate; Appendix B includes detailed forecast tables; and Appendix C includes the simulation analysis tables.

2. MODEL OUTLINE

2.1 STRUCTURAL TAXONOMY

In the Mark II version of the Motor Vehicle Demand Model, the market is analyzed as the sum of (1) personal vehicles--comprising automobiles plus personal-use LDTs, and (2) commercial-use LDTs. The personal vehicles group is then divided into its two components. The disaggregation of automobiles into eight classes is maintained from the Mark I version. Figure 2-1 illustrates the structural taxonomy.

All LDTs under 10,000 lbs GVW are categorized as either personal-use or commercial-use vehicles. The specific classification scheme by nameplate is shown in Appendix A. In general terms, personal-use LDTs are the lighter vans and pickups, as well as all sport utility vehicles. This classification was determined primarily by the ready availability of both cross-sectional and time-series data. The remaining LDTs are considered commercial-use. This classification is not necessarily the ideal scheme and should be considered subject to revision.

2.2 OVERVIEW OF APPROACH

In the cross-sectional analysis using 1976 state data, relationships were estimated for the desired stock of all personal vehicles, the desired stock of automobiles, and the desired stock of commercial-use LDTs. The state data comprised estimates of the stock of vehicles in operation of each type, numerous demographic and economic variables, and estimates of prices, costs of operation, and taxes.

With the long-run equilibrium desired stock relationships established, the "realized" values, new registrations, scrappage, and, hence, actual stocks, are determined by the "gap" between the desired and actual stocks, and transitory income and cost fluctuations, using annual time-series data over the period 1958-76. The general approach parallels that utilized in the original Automobile Demand Model.

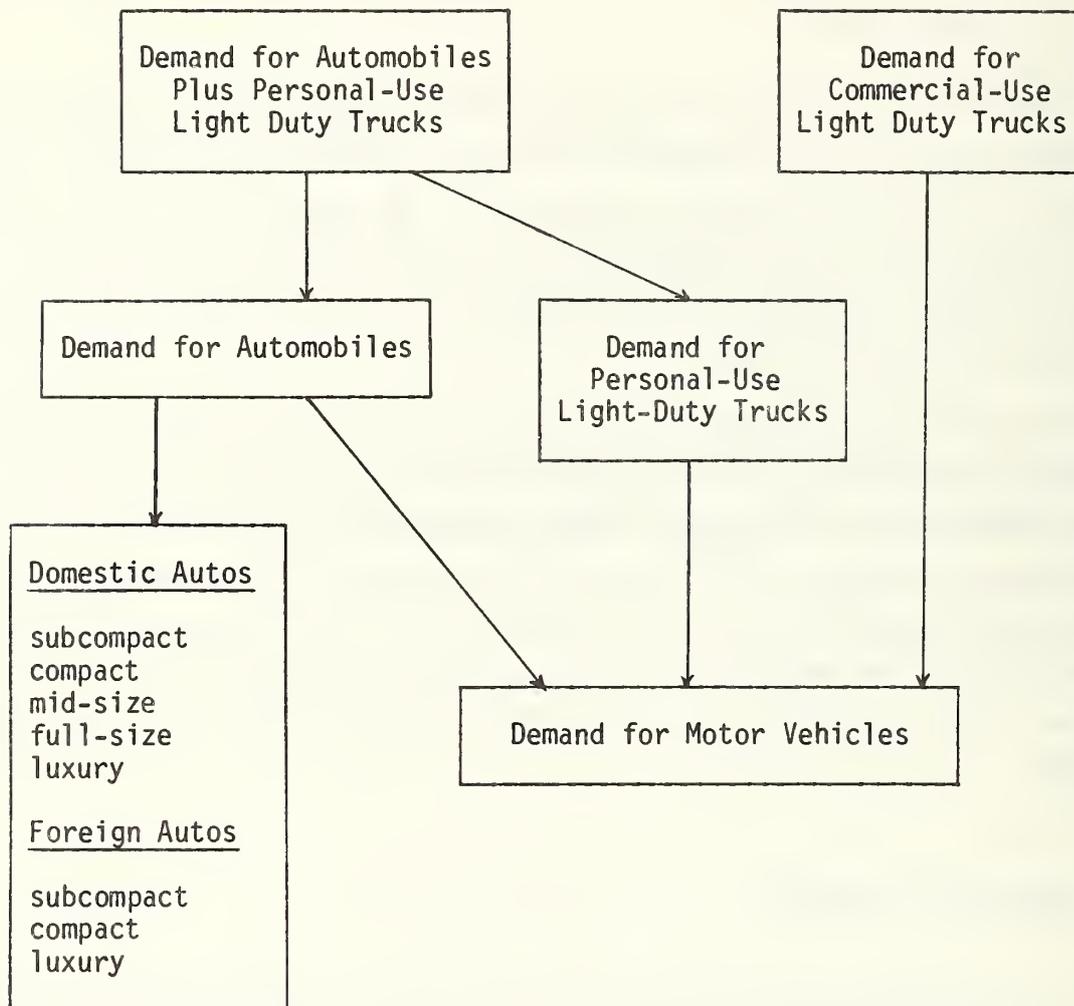

FIGURE 2-1. MOTOR VEHICLE DEMAND ANALYSIS

3. ESTIMATION RESULTS

3.1 DESIRED STOCKS

The Mark II also utilizes cross-sectional estimation of vehicles in operation equations to capture long-run relationships, as did the Mark I. The estimation of automobiles by class is unchanged from the Mark I version. The key relationships reported here, based upon the wholly new 1976 cross-sectional data, are therefore (1) the desired stock of personal vehicles, (2) the desired stock of automobiles, and (3) the desired stock of commercial-use LDTs.

To summarize the major findings:

- a. The personal vehicles and the automobile relationships are found to be strongly linked to the same determinants: real permanent disposable income (+), income distribution (-), real capitalized cost per mile (-), and the degree of suburbanization (+).
- b. The impacts of each variable on stocks of total personal vehicles and on automobiles are of the same sign and order of magnitude.
- c. The stock of commercial LDTs was found to be affected by a very different set of determinants: the proportion of income earned in agriculture, construction, wholesale and retail trade, and services (+), relative to real capitalized cost per mile (-), the rural proportion of road mileage (+), the degree of suburbanization (-), and the proportion of population over 65 (-).

The statistical results are presented in Table 3-1. The equations presented there are those currently used in the model. Many variations were experimented with, such as estimating total cars and all LDTs, total LDTs, and personal LDTs on their own. The personal LDTs consistently had the weakest statistical results throughout, with a great deal of unexplained variation. The commercial LDTs were generally unrelated to the other categories' variation and explanatory variables.

The present structure implies that the personal LDTs desired stock must be derived as a residual, which is clearly less desirable than the ratio split function which was sought. Attempts to estimate an equation for the ratio of personal LDTs to automobiles were unsuccessful because of the difficulty in analyzing both trucks and cars on a more disaggregated basis with the same data set. There is a significant negative correlation, for instance, between full-size cars and personal LDTs. This will be pursued in future research.

Following the estimation, the desired stock values were then translated into time-series estimates, as in Mark I, where time-series were substituted for the cross-sectional values of the right-hand side independent variables. The personal vehicles desired stock and the commercial LDT desired stock were aligned with their actual stock values for 1976. The automobile desired and actual stocks were again assumed to be in equilibrium in 1972. Once again, income distribution was constrained to its 1968 and pre-1968 value in order to prevent this saturation variable from having a positive effect on desired stock. The resulting values of desired (and actual) stocks are shown in Figures 3-1 and 3-2.

Figure 3-1 shows the automobile desired stock (AUTOSD) to be greater than the actual (AUTOSA) during the 1960s. It then becomes coincident from 1971-1973, falling below the actual with the 1974-75 recession. A similar cyclical pattern follows for the personal vehicles desired stock (PERSD), which coincides (by assumption) with the actual (PERSA) in 1976.

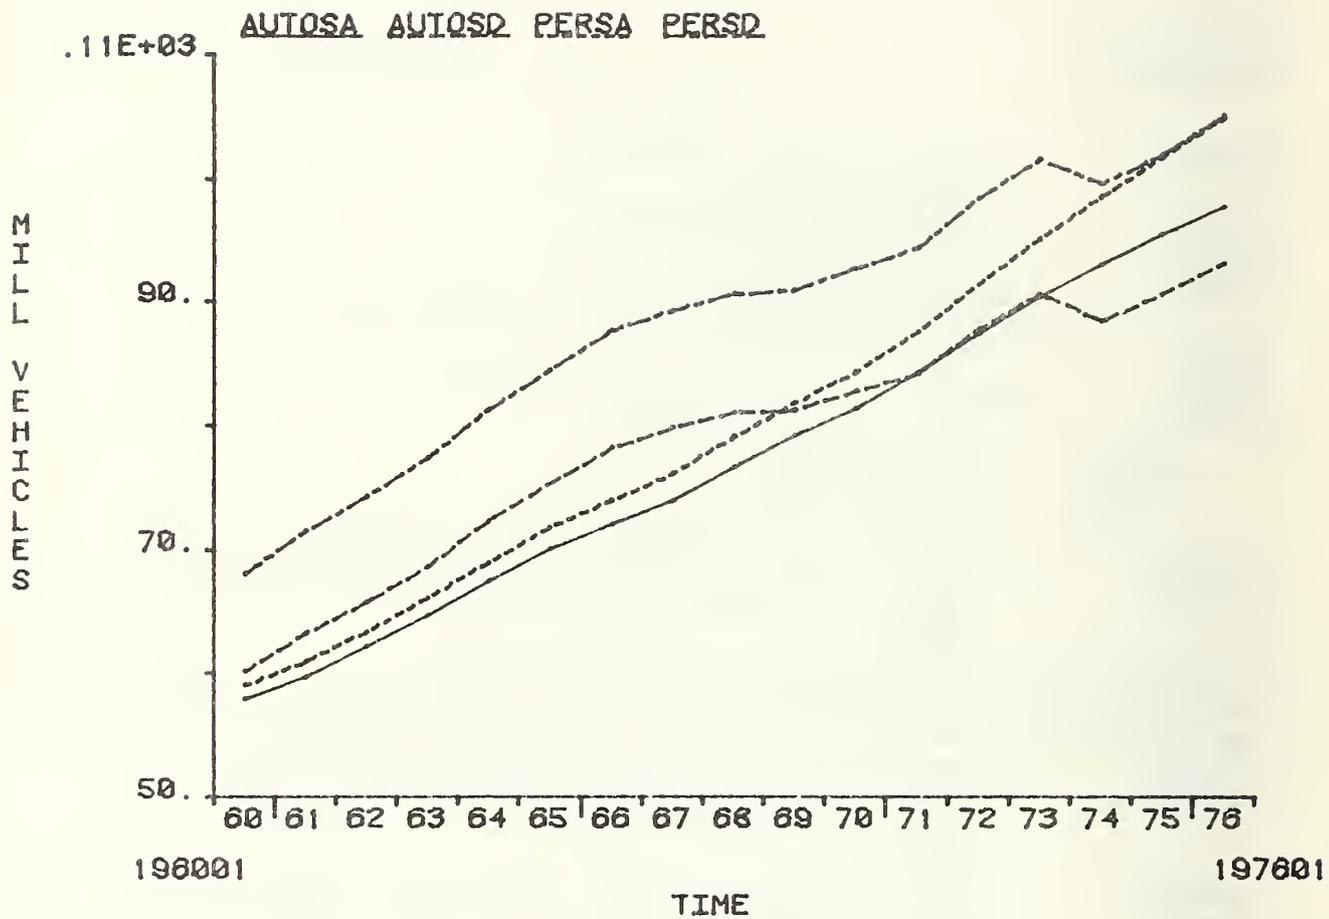

FIGURE 3-1. DESIRED VS. ACTUAL STOCKS (Automobiles and Personal Values)

FIGURE 3 - 2
 WHARTON EFA MOTOR VEHICLE MODEL
 DESIRED VS ACTUAL STOCKS
 PERTRA PERTRD COMTRA COMTRD

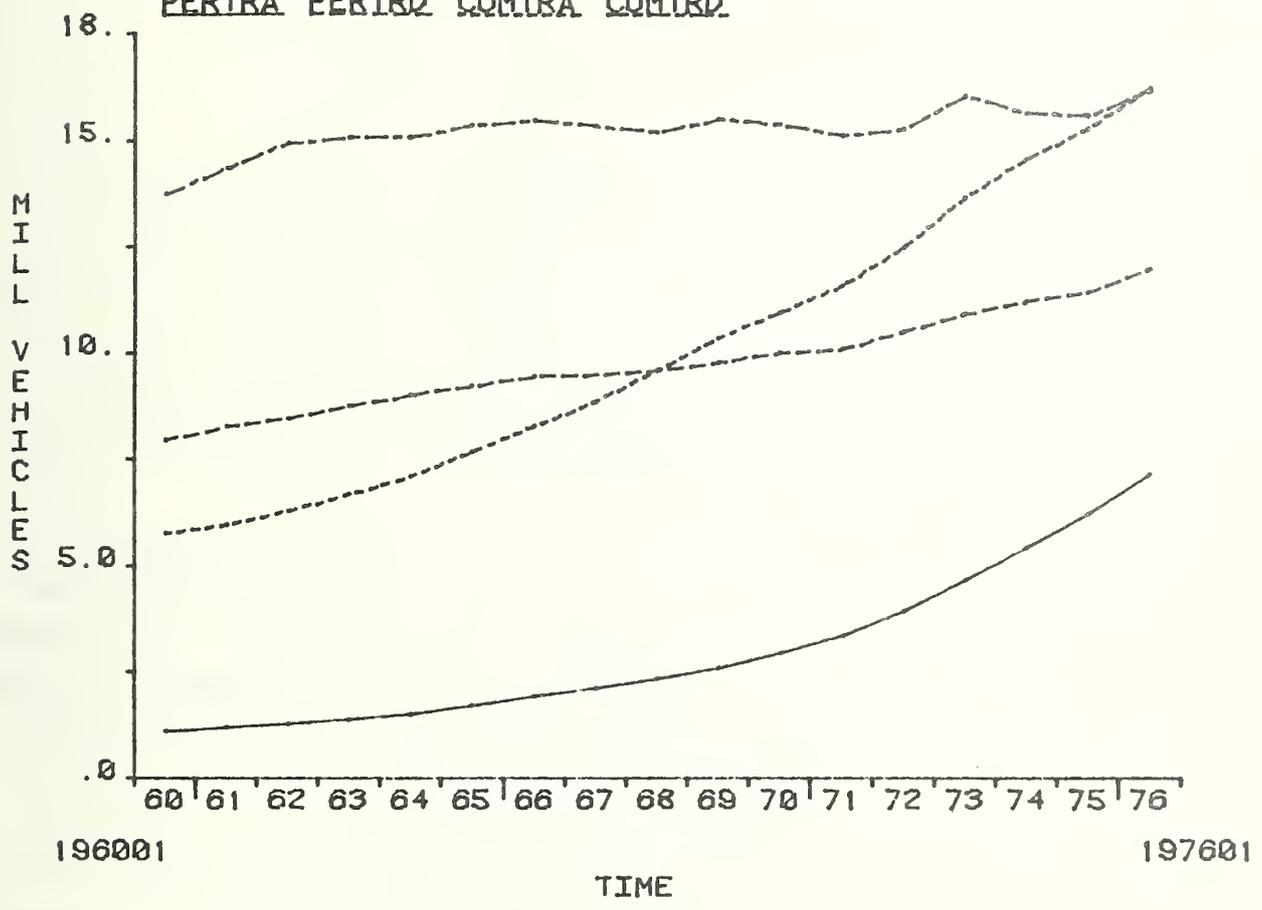

FIGURE 3-2. DESIRED VS. ACTUAL STOCKS (Personal and Commercial LDTs)

Figure 3-2 shows that the personal LDT desired stock (PERTRD) is well above the actual (PERTRA), and, despite the very rapid stock increase during the 1970s, the proportional difference is still very large. The commercial desired and actual stocks, COMTRD and COMTRA, respectively, are proportionately closer, with slower growth rates during the 1970s.

3.2 NEW REGISTRATIONS

The new registrations equations use the same approach as adopted in Mark I. The rate of new registrations, relative to last period's stock less current scrappage, is related to the ratio of desired to actual stock, the rate of change in real disposable family income, the rate of change in prices, and an auto strike dummy. For the commercial LDTs, the income term is defined in terms of the same economic activity variable (agricultural income, etc.) found significant in the cross-sectional analysis.

The equation results are given in Table 3-2. From a behavioral viewpoint, the major result is the weaker impact of the desired stock terms compared to previous results. Also, personal vehicles and commercial LDT equations have notably stronger income effects. Attempts to estimate a separate personal LDT equation were unsuccessful despite the reasonable values estimated for the desired stock. An equation was, therefore, estimated relating new registrations for cars relative to personal LDTs as a function of the relative desired stocks, rates of income change, and their relative capitalized costs per mile. Statistically, the results are strong, but the elasticities are unreasonably high. We are continuing to experiment with this approach.

The cyclical nature of new registrations by category (automobiles: AUTONR; personal LDTs: PERSNR; commercial LDTs: COMMNR) can be seen in Figure 3-3. With few exceptions, autos have the lowest growth rates, while personal LDTs have the highest. The surge in personal LDTs sales resulting from the introduction of several new models in the mid-1960s can clearly be seen.

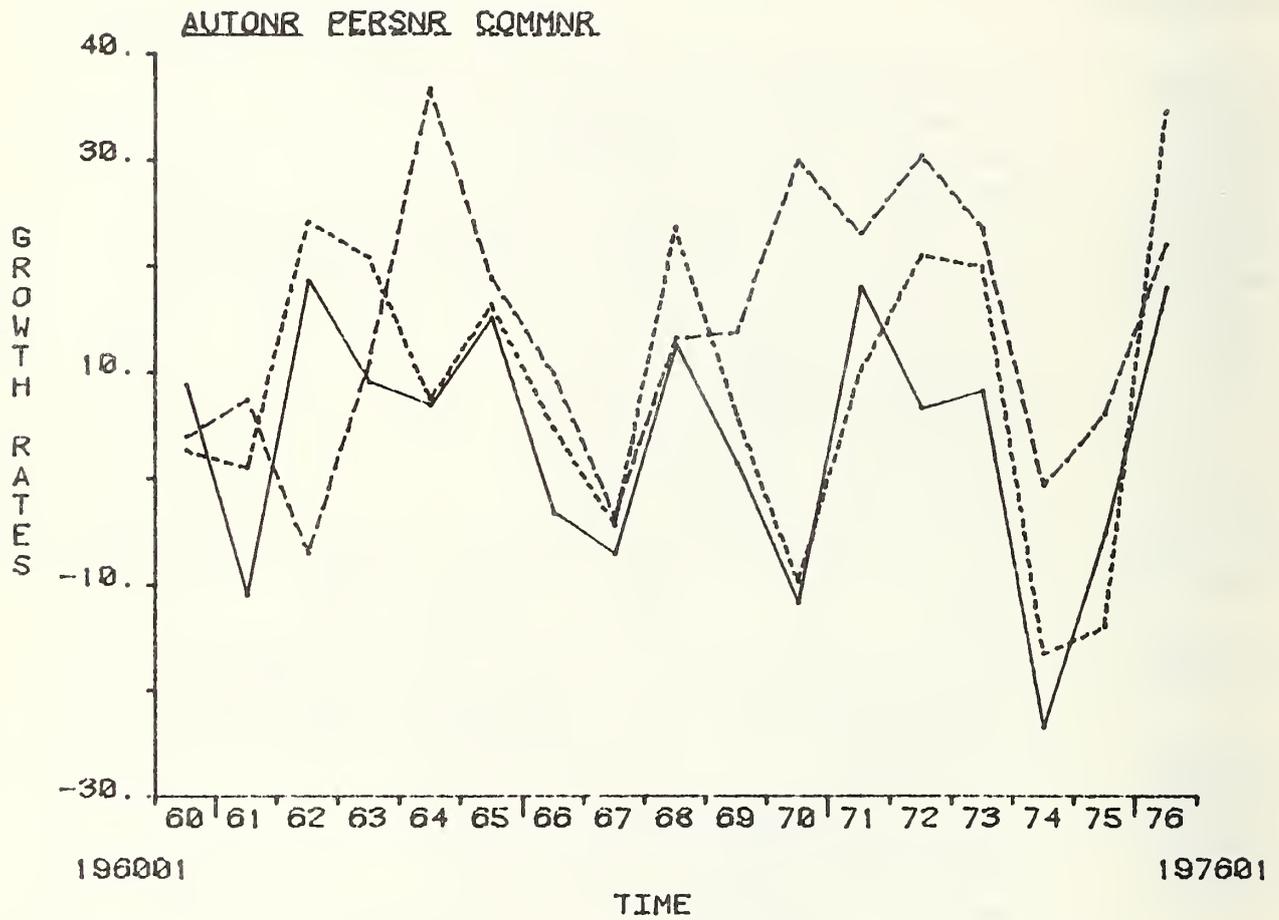

FIGURE 3-3. NEW REGISTRATIONS--GROWTH RATES

3.3 SCRAPPAGE

The scrappage functions again parallel the approach used in Mark I. A notable difference lies in the sensitivities with respect to desired stocks being lower (in absolute terms). A dummy variable for 1973 was experimented with when scrappage was at an unusually high rate. The estimation results are presented in Table 3-3. The extremely cyclical nature of the historical data is clearly illustrated in Figure 3-4, where the overall scale runs between -30 percent to +50 percent for annual growth rates.

3.4 VEHICLE MILES

After extensive experimentation, the vehicle miles relationships shown in Table 3-4 are currently being used. These estimate urban miles of automobile travel per family, auto rural (non-urban) miles per family, personal LDT miles traveled per vehicle, and miles traveled per commercial LDT. Each equation contains a real fuel cost variable (in 1972\$ per mile.) The elasticities are:

- .226 for rural auto mileage,
- .261 for urban auto mileage,
- .276 for personal LDT travel, and
- .590 for commercial LDT travel.

Although the last is rather high, the ranking and orders of magnitude are clearly appropriate.

For urban auto miles driven, income per capita, weighted over three periods, and the stock of vehicles per family, weighted by the proportion of the population living in metropolitan areas, are included. A dummy for 1973-74 was also included; its effect is quite small (-1.5 percent) and it is relatively insignificant.

| RWMMV | = | Roadway Mileage, Total |
| PER15+ | = | % of Families with Income Over \$15,000 in 1970\$ |

For non-urban auto driving, income distribution was found to be the appropriate variable, possibly reflecting leisure and recreational usage. Also, interstate highway roadway mileage relative to the total has a positive impact. A more significant dummy variable effect was found for 1974. These parameter estimates suggest that non-urban driving will continue its past decline relative to total travel.

For personal LDTs, the expected positive impact from income distribution was found, as well as a very significant positive effect from urban population. This may reflect their increasing purchase for recreational/leisure purposes by people in urban areas.

The commercial LDTs usage is strongly linked to the economic activity variable (agriculture, trade, etc.) found to be a significant factor affecting desired stock and sales. Again, this is expressed as a weighted sum of the last three years values.

3.5 PURCHASE PRICES

New base purchase price equations were estimated for automobiles, personal LDTs, and commercial LDTs. Each is linked to our index of input costs, an I/O coefficient weighted combination of all industry inputs. In performing the estimation for automobiles, a significant shift in behavior was discovered when estimating over 1964-76 (the estimation period for LDT prices). A significantly higher elasticity than in the 1959-76 period was also found. These elasticities range from 1.15 to 1.19; i.e., base prices increase from 15 percent to 19 percent more rapidly than input costs. (See Table 3-5.)

4. FORECAST RESULTS

4.1 ASSUMPTIONS

The economic inputs utilized for this forecast come from the Wharton Annual Model Control Forecast of September, 1978. Important macroeconomic assumptions are:

(1) Demographic

Higher population growth projections, as estimated in Current Population Report P-20, Series B-II, Bureau of the Census, July 1978. The Annual Model and the Motor Vehicle Model are consistent in utilizing these projections for total population, family formation, and age distribution.^{1/}

(2) Fiscal and Monetary Policy

An income tax cut of \$16 billion is assumed, effective January 1, 1979, with a further cut of \$16 billion in 1980. The federal deficit was projected at \$26 billion in 1979 and \$40 billion in 1980, with defense expenditures rising only slightly in real terms, while non-defense expenditures (in 1972\$) increase by over 7 percent per year in 1979-80. Monetary policy is relatively restrictive, with negative free reserves through 1980 and a discount rate assumed to rise to 7.45 percent by 1981.

^{1/}Details are shown in Table 17 of the Forecast Tables, Appendix B.

(3) Energy Trends

The final energy bill was assumed to include the tax credits for conservation measures, and for investment in co-generation and energy conserving equipment, plus the increase in the interstate natural gas ceiling price and "new gas" deregulation. Crude oil imports prices were assumed to rise by 6.5 percent and 7.4 percent in 1979-80, and 5.5 percent thereafter. Alaskan production is assumed to rise to 1.2 million bbls/day in 1979 and 2.0 million bbls/day in 1980.

Since these assumptions were made, national economic policy has pursued greater fiscal and monetary restraint, and OPEC prices have been increased extremely rapidly in 1979. Hence the cyclical and long-term pattern of the forecast can be expected to shift significantly.

Key assumptions specific to the Motor Vehicle Model are:

(1) Autos Fuel Economy

The annual CAFE requirements through 1985 are met without substantial market distortions. In order to accomplish this, a "downsizing" program by class of car through 1985, along with assumed technical efficiency gains in fuel economy due to electronics, dieselization, transmission improvements, varying displacement engines, etc. has been projected. The 1985 curb weights for domestics are about 20 percent below their 1978 levels, engine displacements are reduced 30-40 percent, while the efficiency gains increase "on the road" mpg's by 18 percent compared to 1978.^{1/} No further mpg improvements are projected after 1985.

^{1/} These assumptions are shown in detail in Tables 20, 21, and 22 of the Forecast Tables, Appendix B.

(2) LDT Fuel Economy

Compliance with the recently announced LDT CAFE standards through 1982 is assumed, with no change projected thereafter. The new vehicle "on the road" mpg projections for 1982 are:

| | | |
|-------------------------|-------|---------------------------------------|
| Personal LDT (MPGPT) | 15.48 | (+ 41% over 1977 level) |
| Commercial GVW1 (MPGC1) | 16.20 | (+ 41% over 1977 level) |
| Commercial GVW2 (MPGC2) | 12.71 | (+ 19% over 1977 level) ^{1/} |

(3) Imports

To account for Volkswagen of America production and loss of "captives," imports subcompacts will be reduced some 250,000 units below what they would otherwise have been. Domestic sales are correspondingly increased.

(4) Air Bags

It has been assumed that air bags will be required to meet the passive restraint safety standards coming into effect in the 1982-84. This has a significant impact since this adds about 3.5 percent to base purchase prices for each vehicle class. This is a pessimistic assumption insofar as automatic safety belts, etc., may be found to be an effective and cheaper alternative.

^{1/} Assuming that over half the commercial GVW2 LDTs are unaffected by the standards, due to being over 8,500 lbs. Annual values are given in Table 32.10 of Appendix B.

4.2 SUMMARY OF RESULTS

General economic trends of importance are the lack of growth in real disposable family income and the surge in inflation in the 1979-81 period. After 1981 real income per family averages 1 percent per annum growth, while the consumer price index grows by over 5.8 percent on average (Figures 4-1 and 4-2).^{1/}

1978 is a record year for total new registrations of cars and light trucks, with 14.7 million vehicles, 11 million of these being autos and vans registered as autos. This is very close to our 1976 forecast. The 1979-81 period shows weak demand, with 1981 sales being only 1.6 percent above 1978. Recent events will undoubtedly lead to a much more significant sales decline in 1979-80. There is a strong recovery cycle in 1982-84, followed by a downturn in 1985-86, with sales recovering moderately thereafter. The overall average annual rate of growth, 1978 to 1988, is 2.1 percent.

The growth rates in Figure 4-3 show that personal LDT sales continue to lead the market, although at somewhat slower rates than in the past. The 1988 peak of nearly 3 million new registrations represents an annual average growth rate of 6.2 percent. In contrast, automobile sales register sharper declines in 1979 (down 2.6 percent) and 1985 (2.2 percent), averaging only 1 percent per annum growth over the next decade. The outlook for commercial LDTs parallels the personal truck pattern but is weaker, especially during periods of economic weakness. The overall growth averages 3.3 percent per year.

The growth of vehicles in operation, year-end (Figure 4-4) parallels the new registrations trends. The 1978 total is estimated to be 129.3 million, with 101.3 million cars (78 percent), 18.6 million commercial LDTs (14 percent), and 9.5 million personal LDTs (7 percent). By 1988 total vehicles are projected to reach 172.2 million, an average annual growth rate of 2.9 percent, slightly below the 1968-78 rate of 3.8 percent. Of this total, 69 percent will be cars (1.6 percent annual growth), 13 percent will be personal LDTs (9.2 percent per annum), with commercial LDTs accounting for 18 percent (5.2 percent per annum).

^{1/}See Table 18, Appendix B, for details of economic trends.

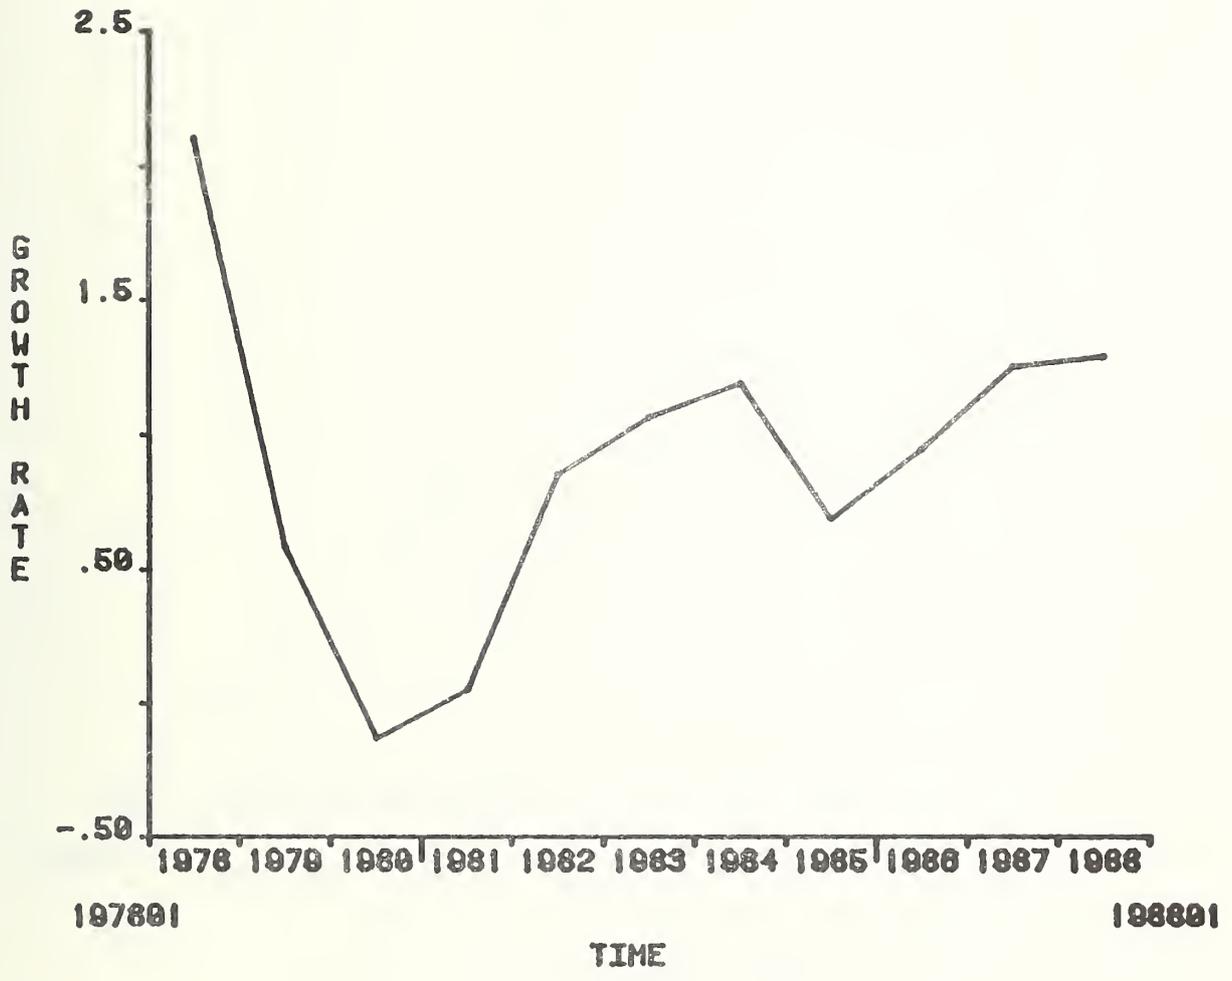

FIGURE 4-1. FORECAST, REAL DISPOSABLE INCOME PER FAMILY

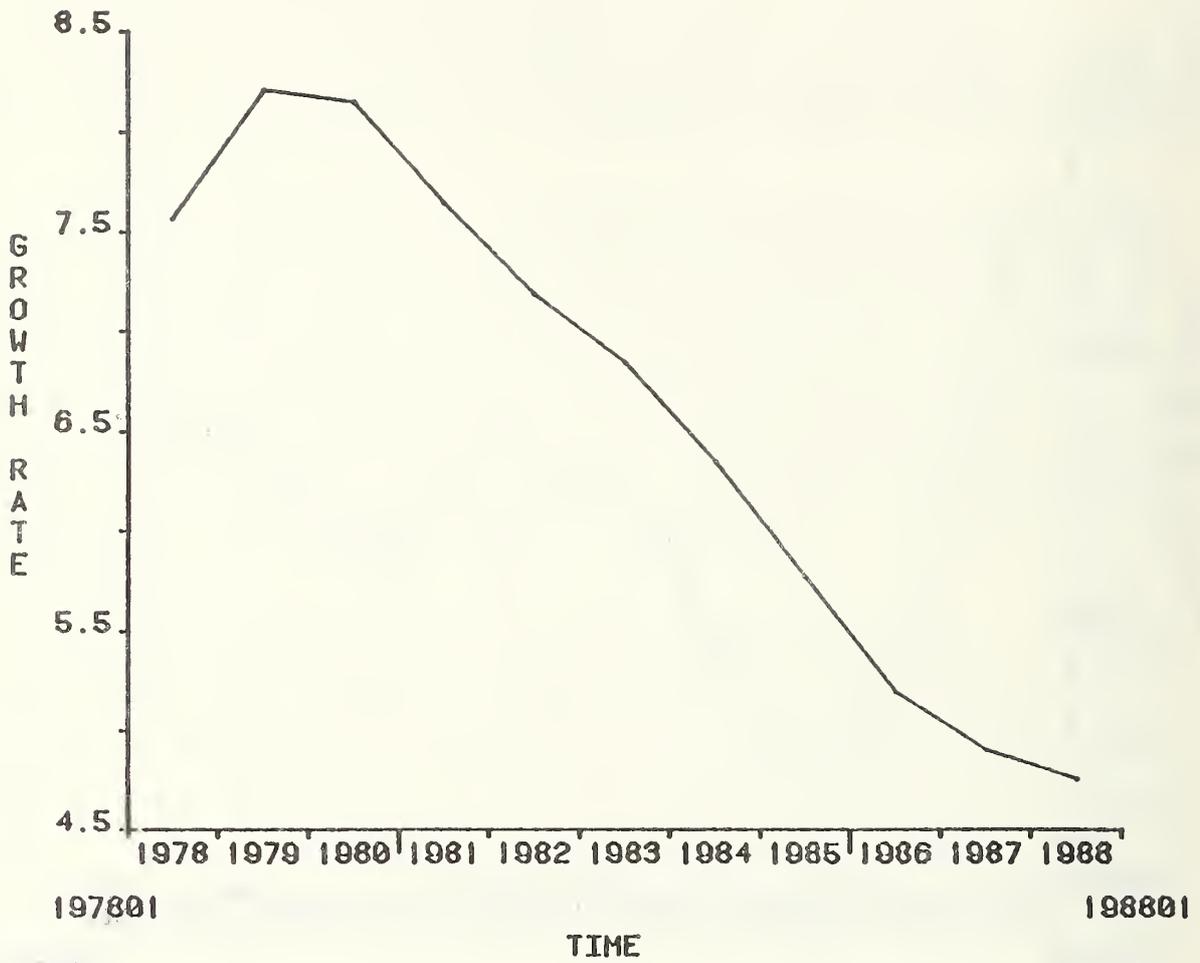

FIGURE 4-2. FORECAST, CONSUMER PRICE INDEX

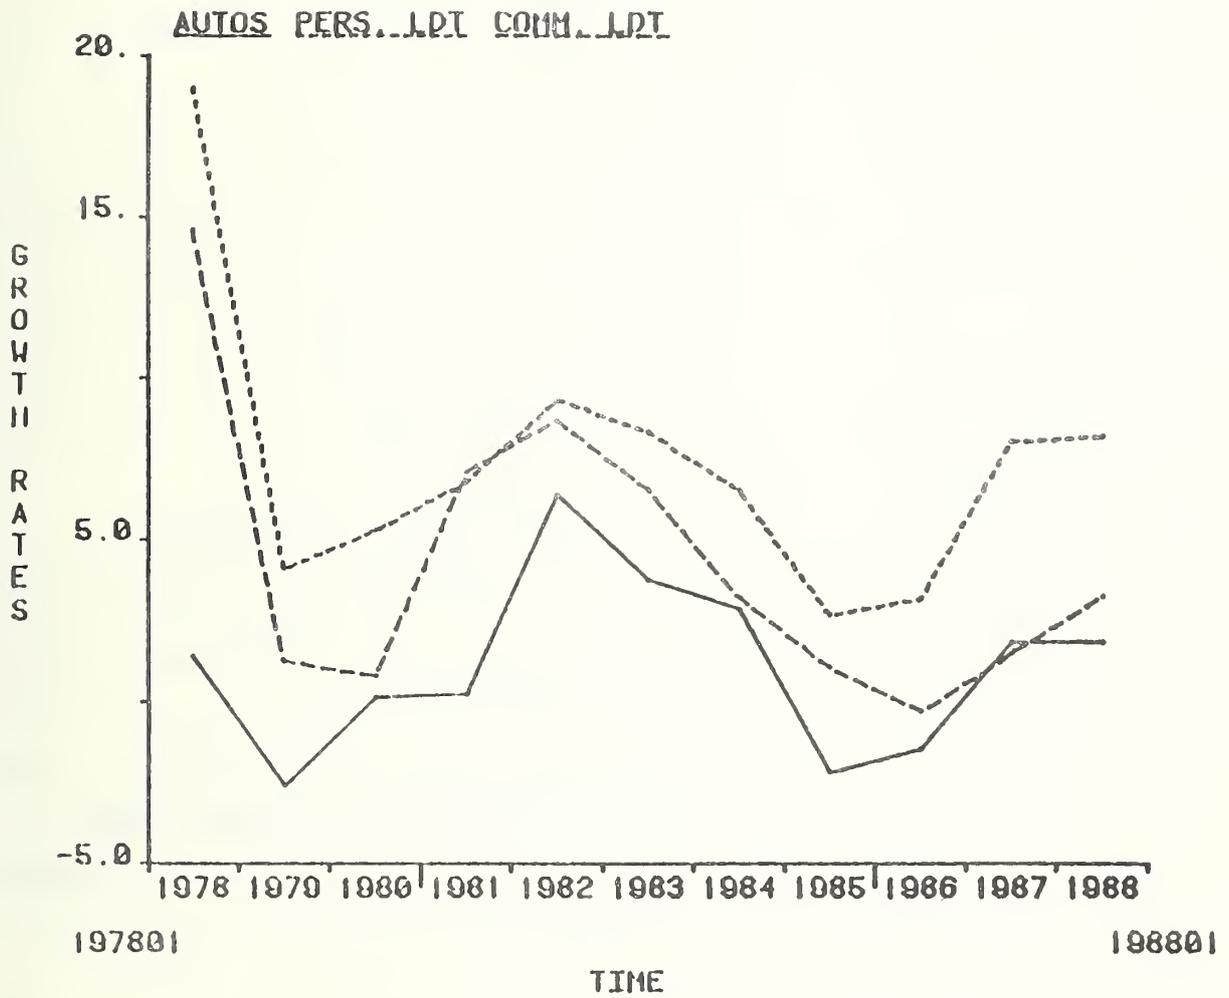

FIGURE 4-3. FORECAST, NEW REGISTRATIONS

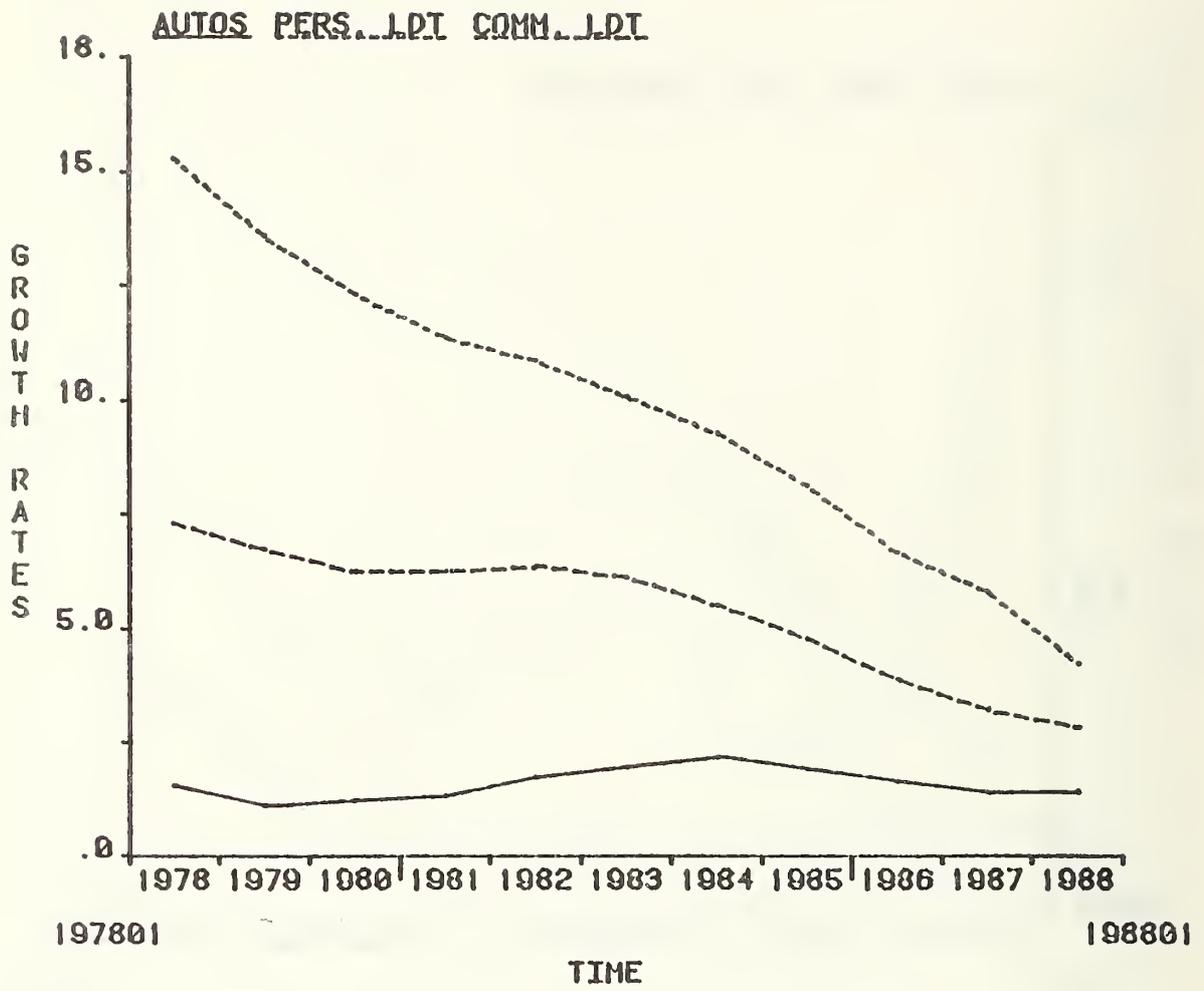

FIGURE 4-4. FORECAST, VEHICLE STOCKS

A major factor acting to slow growth below historical trends is the high growth of purchase prices. Figure 4-5 shows that prices increase annually 9 percent or more through 1982. While growth rates thereafter trend downwards, the increases continue to exceed the general inflation rate.

From the viewpoint of assessing current and future policy the key question is the projection of fuel consumption. There are three components: the change in the vehicle stock, the change in miles driven per vehicle, and the change in fleet average fuel economy. Miles driven per vehicle (Figure 4-6) by personal LDTs grow most rapidly at just under 0.7 percent per year with autos a close second, averaging over 0.5 percent. Commercial LDTs are the slowest, with miles per vehicle growing by just over 0.3 percent per year.

Combining the above trends with the vehicle stock projections, total miles driven by all cars and light trucks grow from an estimated 1.4 billion miles in 1978 to over 2 billion by 1988, a 3.5 percent growth-rate. In forecasting average fuel economy for each vehicle, mpg is estimated for each vintage, and hence changes in the fleet average will depend upon the new vehicle mpg, the sales rate, and the scrappage rate. We have projected design parameters for automobiles that imply compliance with the CAFE standards for the industry as a whole. Hence, the autos fleet average grows rapidly, especially from 1982 onward, averaging 3.5 percent per year for the 1978-88 period. The current standards for LDTs have been incorporated without any extensions beyond 1982. On this basis, the personal LDT fleet average grows by 2.5 percent per year, while commercial LDTs register a 1.5 percent rate (Figure 4-7).

As a result of these trends total fuel consumption by all cars and light trucks continues to grow throughout the forecast period (Figure 4-8). The average growth rate is 0.8 percent; however by 1988 the annual increase is only 0.3 percent. The trends by vehicle type are, of course, quite divergent. Fuel consumption by automobiles begins to decline significantly in 1981. By 1988 consumption is down 10 billion gallons from the 1978 estimate, an average annual decline of 1.2 percent. Fuel consumed by LDTs, on the other hand, increases by 19 billion gallons over the decade, increasing at a 5.4 percent rate. A general summary of key results is given in Table 4-1.

|-----------------|-----------|
| Consumer Prices | 6.5 (6.5) |
| Fuel Price | 6.8 (6.8) |

5. SIMULATION ANALYSIS

The simulations reported here are initial experiments with the current model. Therefore, some of the results summarized in the following sections and the detailed results contained in Appendix B are subject to change as anomalous results are identified and corrected. All of the input changes occur in 1980, except for the Extended Truck MPG Standards, and are a shift in the level of the value (as opposed to a continuing change in the rate of growth). Hence, short-term and long-term impacts are very different, and it is primarily the 5 year and 10 year changes that are reported here.

| 5.1 | <u>2% INCREASE IN PERSONAL INCOME</u> | <u>% DIFFERENCE FROM CONTROL</u> ^{1/} |
|-----|---------------------------------------|--|
| | <u>New Registrations:</u> Autos | 8.36 (1980) |
| | Personal LDTs | 15.60 |
| | Commercial LDTs | 15.97 |
| | <u>Mid-Year Stock:</u> Autos | 0.62 (1985) |
| | Personal LDTs | 4.48 |
| | Commercial LDTs | 3.02 |
| | <u>Miles per Vehicle:</u> Autos | 0.58 (1985) |
| | Personal LDTs | 0.60 |
| | Commercial LDTs | 5.23 |
| | <u>Fleet Average MPG:</u> Autos | -0.12 (1985) |
| | Personal LDTs | 0.32 |
| | Commercial LDTs | 0.22 |
| | <u>Fuel Consumed:</u> Autos | 1.31 (1985) |
| | Personal LDTs | 4.77 |
| | Commercial LDTs | 8.17 |
| | Total Fuel | 3.24 |

^{1/} The Control Forecast used for these simulations is slightly different from the forecast described in Section 4. Hence the tables in Appendix B do not contain the same "Control" results as those in Appendix C.

The sales impacts are a short-run response with rapid decay; since scrappage also rises, the stock effects are less dramatic. In addition to increasing personal income by 2 percent, the ratio of income earned in agriculture, etc., relative to the total was also raised 2 percent; hence the large impacts for commercial LDTs.

| 5.2 | <u>5% INCREASE IN TRUCK PRICES</u> | <u>% DIFFERENCE FROM CONTROL</u> | |
|-----|------------------------------------|----------------------------------|--------------|
| | <u>New Registrations:</u> | Personal LDTs | -6.22 (1980) |
| | | Commercial LDTs | -5.27 |
| | <u>Mid-Year Stock:</u> | Personal LDTs | -1.15 (1985) |
| | | Commercial LDTs | -0.97 |
| | <u>Cap. Cost per Mile:</u> | Personal LDTs | 2.27 (1985) |
| | | Commercial GVW1 | 1.96 |
| | | Commercial GVW2 | 1.78 |
| | <u>Fuel Consumed:</u> | Personal LDTs | -1.11 (1985) |
| | | Commercial LDTs | -0.94 |
| | | Total Fuel | -0.35 |

The only deficiency in the current system is the lack of impact on autos, which 'a priori' might occur with a truck price change.

| 5.3 | <u>10% INCREASE IN GASOLINE PRICES</u> | <u>% DIFFERENCE FROM CONTROL</u> | |
|----------------------------|--|----------------------------------|--------|
| <u>Mid-Year Stock:</u> | Autos | -0.47 | (1990) |
| | Personal LDTs | -0.40 | |
| | Commercial LDTs | 0.23 | |
| <u>Cap. Cost per Mile:</u> | Autos | 1.21 | (1990) |
| | Personal LDTs | 1.44 | |
| | Commercial GVW1 | 1.73 | |
| | Commercial GVW2 | 2.33 | |
| <u>Miles per Vehicle::</u> | Autos | -2.27 | (1990) |
| | Personal LDTs | -2.60 | |
| | Commercial LDTs | -5.46 | |
| <u>Fuel Consumed:</u> | Autos | -2.74 | (1990) |
| | Personal LDTs | -2.97 | |
| | Commercial LDTs | -5.24 | |
| | Total Fuel | -3.40 | |

A problem with this simulation is that scrappage falls an unlikely amount in response to the VMT changes, which caused the perverse commercial stock response.

| 5.4 | <u>EXTENDED TRUCK MPG STANDARDS</u> | <u>% DIFFERENCE FROM CONTROL</u> | |
|----------------------------|-------------------------------------|----------------------------------|---------|
| <u>Mid-Year Stock:</u> | Personal LDTs | 0.62 | (1985) |
| | Commercial LDTs | 0.23 | |
| <u>Mid-Year Stock:</u> | Personal LDTs | -0.09 | (1985) |
| | Commercial LDTs | 0.04 | |
| <u>Cap. Cost per Mile:</u> | Personal LDTs | -2.35 | (1985) |
| | Commercial GVW1 | -2.70 | |
| | Commercial GVW2 | -2.46 | |
| <u>Miles per Vehicle:</u> | Personal LDTs | 2.76 | (1990) |
| | Commercial LDTs | 4.14 | |
| <u>Fleet Average MPG:</u> | Personal LDTs | 10.37 | (1990) |
| | Commercial LDTs | 7.12 | |
| <u>Fuel Consumed:</u> | Personal LDTs | -7.58 | (1990)+ |
| | Commercial LDTs | -2.92 | |
| | Total Fuel | -1.98 | |

New truck mpgs were increased after 1982, as follows:

| | <u>1982</u> | <u>1983</u> | <u>1984</u> | <u>1985 on</u> |
|-----------------|-------------|-------------|-------------|----------------|
| Personal | 15.48 | 16.48 | 17.48 | 18.48 |
| Commercial GVW1 | 16.20 | 17.20 | 18.20 | 19.20 |
| Commercial GVW2 | 12.71 | 13.21 | 13.71 | 14.21 |

The simulation does not incorporate the higher LDT prices that presumably would result from these mpg improvements. Again, the stock values may be too low if the impacts of VMT changes are overstated, since the capitalized cost per mile have relatively weak impacts.

APPENDIX A
LDT CLASSIFICATION BY TYPE

Personal-use LDTs comprise:

- (1) Passenger vans included in automobile registrations: Voyager, Sportsman, Club Wagon, Sportvan, VW Bus.
- (2) The following GVW Class 1 and 2 truck models (1977):

Chevrolet Vans, El Camino, LUV, Suburban, Blazer

Dodge Vans, Trail Duster, Ramcharger

Ford Econoline, Ranchero, Bronco, Courier

GMC Vandura, Suburban, Jimmy, Sprint

International Scout

Jeep CJ5, CJ7, Commando

All imports

Commercial use LDTs comprise all other GVW1 and 2 trucks, almost all of these being pick-ups, with a few panel vans and multi-stops.

APPENDIX D
REPORT OF NEW TECHNOLOGY APPENDIX
Contract DOT-TSC-1435

The Wharton EFA, Inc. Motor Vehicle Demand Model

The work performed under this contract has not led to any new inventions. The resulting econometric model is, however, both innovative and state-of-the-art. It provides long-run policy analysis and forecasting of annual trends in the U.S. motor vehicle market, given various policy options and alternative socio-economic futures.
